DOUBLE TRACK LOW HEADROOM HARDWARE

Double track low headroom hardware was specifically designed to make the replacement of 2 piece swing-out doors, or 1 piece wood or steel tilt-up doors, possible with more attractive and practical sectional overhead doors.

With this special double track system, we can now install a sectional garage door in only 4" of headroom and accommodate a garage door opener in an additional 2" - for a total of 6" of required headroom.

Because the double track requires so little headroom, it often eliminates or reduces the need to frame down the opening, to acquire the necessary headroom. This benefit saves you money in framing costs and the added expense of a non-standard door size.

The hardware was designed, in such a way, as to provide for smooth and easy manual operation. It is not necessary with this hardware to have a garage door opener installed.
